FOR IMMEDIATE RELEASE

ISC Releases SecretAgent® Document Access Servlet™

DEERFIELD, IL – July 27, 2005 — Information Security Corporation (ISC) today announced the immediate availability of SecretAgent Document Access Servlet™ (DAS). Complementing SecretAgent 5.9, the latest release of ISC's leading file encryption utility, DAS allows sensitive documents to be securely shared among the frequently changing members of one or more 'Communities of Interest' (CoIs).

SecretAgent DAS provides a web-based administrative interface for all system configuration, key management, and CoI maintenance tasks. Administrators can easily grant or deny users access to large numbers of sensitive files using centrally-managed CoI membership rosters based on DAS' own integrated certificate database or an organization's existing LDAP repository.

"SecretAgent DAS provides a solution to a mission critical problem encountered by a wide range of organizations," said ISC President Thomas J. Venn. "Once sensitive files have been encrypted for a group, DAS ensures that those files can only be decrypted by *current* members of that group. Use of such a server-mediated decryption process means that no wholesale re-keying of documents is required each time the group's membership roster changes."

Availability and Pricing

DAS is available immediately for worldwide shipment subject to U.S. export controls. It requires SecretAgent 5.9 or higher on all client systems. Contact ISC for site license pricing, quantity discounts, and additional product information.

About Information Security Corporation

Founded in 1989, ISC has focused on the development of affordable encryption and authentication software products designed around well-established cryptographic standards. The most security-conscious government agencies and corporations worldwide have adopted ISC products.
